Mena Whalen ★

Yes what Charles said is correct. Think about Dem = yes/Independent and Independent = yes/Rep

It should be the first one you mentioned. Although, I don't believe this has to do with partitioning the χ^2 , it's just determining the third odds ratio given the other two. I'm not sure how much I can share, but what I did was I created a sample table (similar to Table 2.13 in Problem 2.17, but the row labels were "Yes" and "No" instead of race) that fit the odds ratios for Democratic-Independent and Independent-Republican, then calculated the odds ratio for Democratic-Republican.
